# Preseem for Fiber & Hybrid Networks

Proactive Growth, Customer Support, and Network Operations for ISPs.

Preseem provides a single platform for fiber and hybrid network operators to manage subscribers across all access technologies and vendors.

Our platform proactively measures and improves the subscribers' quality of experience to prevent churn, drive growth, reduce support calls, and increase operational efficiency.

You also get dozens of pre-built integrations that extract information from all elements and systems, giving you actionable metrics and intelligence for all of your teams, all in one place.

See Everything in One Place
Get a network-wide overview of your equipment and subscribers, across all vendors and access technologies. Drive operational efficiency by proactively identifying issues before they affect your customers.

Save on Training and Support
Your teams will love being able to see and understand the whole network without having to master each vendor management platform, leading to lower training costs and faster support resolution times.

Increase Deployment Agility
Our automatic topology discovery and pre-built integrations provide increased flexibility to add new vendors and models to the network without costly and time-consuming integration or testing projects.

*"Having our fiber networks and customer status available in Preseem **removes any requirement for separate management portals or services,** allowing our customer service representatives to provide the fast, consistent, and seamless experience for both fixed wireless and fiber customers that Primo is known for."*

- Talor Green, Network Team Leader, Primo
